Filed : **November 30, 2001**

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application. In the listing, Claims 13, 15-18, and 31-33 have been amended.

1. **(Original)** A hard disk drive comprising:
 - a rotatable disk having a magnetic recording media wherein the rotatable disk defines a plurality of concentric servo tracks;
 - a pivotable actuator that is movable with respect to the rotatable disk;
 - a transducer disposed on the actuator so as to be positioned with respect to selected ones of the plurality of concentric servo tracks;
 - a controller that controls the movement and position of the transducer with respect to the selected servo tracks;
 - a shock detection system that analyzes a signal indicative of a movement of at least a portion of the hard disk drive and determines whether the hard disk drive has experienced a shock event; and
 - a shock event logger that records information about the shock event as determined by the shock detection system.
2. **(Original)** The hard disk drive of Claim 1, wherein the shock event logger records the shock event information to a memory.
3. **(Original)** The hard disk drive of Claim 2, wherein the memory is a non-volatile memory.
4. **(Original)** The hard disk drive of Claim 3, wherein the non-volatile memory is a semiconductor memory.
5. **(Original)** The hard disk drive of Claim 3, wherein the non-volatile memory is a portion of the rotatable disk.

Appl. No. : 10/008,763
Filed : November 30, 2001

6. **(Original)** The hard disk drive of Claim 1, wherein the shock detection system comprises a shock sensor signal processor that analyzes a signal from a shock sensor.

7. **(Original)** The hard disk drive of Claim 6, wherein the shock sensor is an accelerometer that measures linear acceleration.

8. **(Original)** The hard disk drive of Claim 6, wherein the shock sensor is an accelerometer that measures rotational acceleration.

9. **(Original)** The hard disk drive of Claim 6, wherein the shock sensor comprises accelerometers that measure both linear and rotational accelerations.

10. **(Original)** The hard disk drive of Claim 1, wherein the shock detection system comprises a back-emf signal processor that analyzes a back-emf signal generated when the actuator moves.

11. **(Original)** The hard disk drive of Claim 1, wherein the shock detection system comprises a position error signal processor that analyzes the position error signal indicative of a position deviation of the transducer from a reference position.

12. **(Original)** The hard disk drive of Claim 11, wherein the position error signal processor determines that a shock event has occurred when the position error signal exceeds a predetermined threshold value.

13. **(Amended)** The hard disk drive of Claim 12, wherein the predetermined threshold value is a position error signal representing A hard disk drive comprising:

a rotatable disk having a magnetic recording media wherein the rotatable disk defines a plurality of concentric servo tracks;

a pivotable actuator that is movable with respect to the rotatable disk;

a transducer disposed on the actuator so as to be positioned with respect to selected ones of the plurality of concentric servo tracks;

Appl. No. : 10/008,763
Filed : November 30, 2001

a controller that controls the movement and position of the transducer with respect to the selected servo tracks;

a shock detection system that analyzes a signal indicative of a movement of at least a portion of the hard disk drive and determines whether the hard disk drive has experienced a shock event;

a shock event logger that records information about the shock event as determined by the shock detection system; and

wherein the shock detection system comprises a position error signal processor that analyzes the position error signal indicative of a position deviation of the transducer from a reference position and determines that a shock event has occurred when the position error signal exceeds a predetermined threshold value of approximately 32% of a track width.

14. (Original) The hard disk drive of Claim 12, wherein the shock event logger records the position error signal to the non-volatile memory.

15. (Amended) ~~The hard disk drive of Claim 14,~~ A hard disk drive comprising:

a rotatable disk having a magnetic recording media wherein the rotatable disk defines a plurality of concentric servo tracks;

a pivotable actuator that is movable with respect to the rotatable disk;

a transducer disposed on the actuator so as to be positioned with respect to selected ones of the plurality of concentric servo tracks;

a controller that controls the movement and position of the transducer with respect to the selected servo tracks;

a shock detection system that analyzes a signal indicative of a movement of at least a portion of the hard disk drive and determines whether the hard disk drive has experienced a shock event;

Appl. No. : 10/008,763
Filed : November 30, 2001

a shock event logger that records information about the shock event as determined by the shock detection system; and

wherein the shock detection system comprises a position error signal processor that analyzes the position error signal indicative of a position deviation of the transducer from a reference position and determines that a shock event has occurred when the position error signal exceeds a predetermined threshold value; and

wherein the shock event logger records position error signals corresponding to a plurality of shock events in a sequential manner to the non-volatile memory.

16. (Amended) ~~The hard disk drive of Claim 14,~~ A hard disk drive comprising:

a rotatable disk having a magnetic recording media wherein the rotatable disk defines a plurality of concentric servo tracks;

a pivotable actuator that is movable with respect to the rotatable disk;

a transducer disposed on the actuator so as to be positioned with respect to selected ones of the plurality of concentric servo tracks;

a controller that controls the movement and position of the transducer with respect to the selected servo tracks;

a shock detection system that analyzes a signal indicative of a movement of at least a portion of the hard disk drive and determines whether the hard disk drive has experienced a shock event; and

a shock event logger that records information about the shock event as determined by the shock detection system.

wherein the shock detection system comprises a position error signal processor that analyzes the position error signal indicative of a position deviation of the transducer from a reference position and determines that a

Appl. No. : 10/008,763
Filed : November 30, 2001

shock event has occurred when the position error signal exceeds a predetermined threshold value;

wherein the shock event logger records the position error signal to the non-volatile memory; and

wherein the shock event logger records the number of shock events in an incremental register.

17. (Amended) ~~The hard disk drive of Claim 14,~~ A hard disk drive comprising:

a rotatable disk having a magnetic recording media wherein the rotatable disk defines a plurality of concentric servo tracks;

a pivotable actuator that is movable with respect to the rotatable disk;

a transducer disposed on the actuator so as to be positioned with respect to selected ones of the plurality of concentric servo tracks;

a controller that controls the movement and position of the transducer with respect to the selected servo tracks;

a shock detection system that analyzes a signal indicative of a movement of at least a portion of the hard disk drive and determines whether the hard disk drive has experienced a shock event;

a shock event logger that records information about the shock event as determined by the shock detection system;

wherein the shock detection system comprises a position error signal processor that analyzes the position error signal indicative of a position deviation of the transducer from a reference position and determines that a shock event has occurred when the position error signal exceeds a predetermined threshold value;

wherein the shock event logger records the position error signal to the non-volatile memory; and

Appl. No. : 10/008,763
Filed : November 30, 2001

wherein the shock event logger records a histogram of the position error signal, wherein the histogram represents a plurality of shock events.

18. (Amended) ~~The hard disk drive of Claim 1, A hard disk drive comprising:~~

a rotatable disk having a magnetic recording media wherein the rotatable disk defines a plurality of concentric servo tracks;

a pivotable actuator that is movable with respect to the rotatable disk;

a transducer disposed on the actuator so as to be positioned with respect to selected ones of the plurality of concentric servo tracks;

a controller that controls the movement and position of the transducer with respect to the selected servo tracks;

a shock detection system that analyzes a signal indicative of a movement of at least a portion of the hard disk drive and determines whether the hard disk drive has experienced a shock event;

a shock event logger that records information about the shock event as determined by the shock detection system; and

wherein the shock detection system comprises a position error signal processor that monitors an elapsed time taken for the position deviated transducer to return to and maintain a position within a reference window for a predetermined time, wherein the position error signal processor determines that a shock event occurred when the elapsed time exceeds a predetermined duration.

19. (Original) The hard disk drive of Claim 18, wherein the predetermined duration is the time taken for a predetermined number of wedge-to-wedge time intervals encountered by the transducer, wherein the wedge-to-wedge time interval represents a unit of time that depends on the rotational speed of the disk and the number of servo wedges per servo track.

Appl. No. : **10/008,763**
Filed : **November 30, 2001**

20. **(Original)** The hard disk drive of Claim 19, wherein the predetermined duration is 100 wedge-to-wedge time intervals.

21. **(Original)** The hard disk drive of Claim 19, wherein the predetermined duration is 300 wedge-to-wedge time intervals.

22. **(Original)** The hard disk drive of Claim 19, wherein the predetermined duration is 500 wedge-to-wedge time intervals.

23. **(Original)** The hard disk drive of Claim 18, wherein the shock event logger records the elapsed time to the non-volatile memory.

24. **(Original)** The hard disk drive of Claim 23, wherein the shock event logger records elapsed times corresponding to a plurality of shock events in a sequential manner.

25. **(Original)** The hard disk drive of Claim 23, wherein the shock event logger records the number of shock events in an incremental register.

26. **(Original)** The hard disk drive of Claim 23, wherein the shock event logger records a histogram of the elapsed time, wherein the histogram represents a plurality of shock events.

27. **(Original)** A method of logging shock events in a hard disk drive comprising a rotatable disk having a magnetic recording media, the method comprising:

monitoring a signal from a component of the hard disk drive that responds to at least one of displacement, velocity, or acceleration of at least a portion of the hard disk drive;

evaluating the signal to determine whether the at least one of displacement, velocity, or acceleration is a result of a shock event; and

recording information about the shock event.

Appl. No. : 10/008,763
Filed : November 30, 2001

28. (Original) The method of Claim 27, wherein recording comprises logging of information about the shock event to a non-volatile memory.

29. (Original) The method of Claim 28, wherein logging to the non-volatile memory comprises logging to a semiconductor memory.

30. (Original) The method of Claim 28, wherein logging to the non-volatile memory comprises logging to a portion the rotatable disk.

31. (Amended) ~~The method of Claim 28, A method of logging shock events in a hard disk drive comprising a rotatable disk having a magnetic recording media, the method comprising:~~

monitoring a signal from a component of the hard disk drive that responds to at least one of displacement, velocity, or acceleration of at least a portion of the hard disk drive;

evaluating the signal to determine whether the at least one of displacement, velocity, or acceleration is a result of a shock event;

recording information about the shock event;

wherein recording comprises logging of information about the shock event to a non-volatile memory; and

wherein logging of the shock event information is done in a sequential manner.

32. (Amended) ~~The method of Claim 28, A method of logging shock events in a hard disk drive comprising a rotatable disk having a magnetic recording media, the method comprising:~~

monitoring a signal from a component of the hard disk drive that responds to at least one of displacement, velocity, or acceleration of at least a portion of the hard disk drive;

evaluating the signal to determine whether the at least one of displacement, velocity, or acceleration is a result of a shock event; and

Appl. No. : 10/008,763
Filed : November 30, 2001

recording information about the shock event;
wherein recording comprises logging of information about the shock
event to a non-volatile memory; and

wherein logging of the shock event information comprises incrementing a register to keep track of the number of shock events detected.

33. (Amended) ~~The method of Claim 28,~~ A method of logging shock events in a hard disk drive comprising a rotatable disk having a magnetic recording media, the method comprising:

monitoring a signal from a component of the hard disk drive that responds to at least one of displacement, velocity, or acceleration of at least a portion of the hard disk drive;

evaluating the signal to determine whether the at least one of displacement, velocity, or acceleration is a result of a shock event; and

recording information about the shock event;

wherein recording comprises logging of information about the shock event to a non-volatile memory; and

wherein logging of the shock event information comprises recording a histogram of the shock event information, wherein the histogram represents a plurality of shock events.
